How To Use Create/Select Scenario

First, a user must create a scenario by selecting "create a scenario" and choosing from one of the available geographical regions to create sublevels inside of. See the readme about adding new regions for more info on creating new places to create scenarios inside of.

After you have finished setting up your units as you see fit, press the "L" key on your keyboard and name the scenario. From now on when you launch the game, it will appear in your list of scenarios to select from and host. When you choose select scenario, you pick the one you've previously created that you want to load up and then provide it with a description and details for connection to TAK devices through a ZeroTier network or other NAT translation service.
